Example: dog vs. cat?

- We have 5000 pictures of dog and 5000 pictures of cat.

- Computer digitalize each picture into 100×100 pixels.
- Given a new picture, we want to answer: is it a dog or a cat?
- Simple task for human, dog, or cat.
- Golle (2008) claimed this is a difficult task for machines with only 82.7% accuracy.
- In 2013, 98.5% accuracy was reported in a Kaggle competition (https://www.kaggle.com/c/dogs-vs-cats).

Why?

- Is the human verification system safe from machine learning attack.
  - CAPTCHA vs. ASSIRA

- If machine can assign correct label to all pictures, we can google.
